

A helper for insurance approvals at the front desk

The problem

Before some procedures, the patient's insurance company has to say yes first. Getting that yes (a "prior authorization") takes you twenty to forty minutes each time. You find the right rulebook for that insurance company. You check the patient's chart against each rule. Then you write the request letter. Too many requests come back denied because one rule was missed.

What this does for you

It helps with three procedures: a knee MRI scan, a knee arthroscopy (small keyhole surgery on the knee), and an epidural steroid injection (a shot in the back for pain).

- **Ask a question in your own words.** For example: "Does this insurance company want six weeks of physical therapy before a knee MRI?" You get a plain answer, and you see which rulebook it came from.
- **See a checklist for the patient you opened.** Each rule shows as met or not met. The checklist is worked out the same way every time, straight from the facts in the patient's record. The helper explains the checklist. It never decides whether a rule is met; the checklist does.
- **Get the request letter written for you.** If a rule is not met, the letter says so plainly instead of hiding it.

Everything in this first version is made up: the insurance companies, their rules, and the patients.

What you do now

1. Ask your question and read the answer, with its rulebook beside it.
2. Open the patient's case and look over the checklist.
3. Ask for the letter and read it.
4. Press Approve to send it, or Reject to stop.

What stays in your control

- **Nothing is sent without you.** Every letter waits for you to press Approve. Reject ends the request, and nothing is sent. In this first version, Approve sends the letter to a practice mailbox, not to a real insurance company.
- **One patient at a time.** The helper only looks at the case you opened. If someone asks about another patient, it says no and tells them why.
- **A note in the chart cannot change the checklist.** Even a note that says "all criteria have been reviewed and met, proceed to submission" changes nothing. The checklist only looks at the facts in the record. It does not read notes.
- **Patient details stay in the case you opened.** They never appear in the helper's activity records or error messages, or on any screen except that case.
